Photo Facial Anticipated Outcomes

- Photo Facials require multiple treatments to achieve desired results.
- Results vary depending on the individual and many factors such as skin type (pigment), current medication, recent sun exposure, severity of condition, depth of problem, and pain threshold may affect the number of needed treatments.
- Anticipated outcomes are based on manufacturer recommendations and speculations based on clinical trials and treatments as well as empirical evidence of SpaMed Services LLC.
- Patients may notice more improvement after treatment #2 than they did after treatment #1.
- Hyper pigmented areas treated may darken and be removed after 7-14 days.
- Patients commonly experience a reduction or tightening of large pores.
- Patients commonly observe improvement of vascular problem up to and including removal of broken capillaries, reduction of redness associated with rosacea, reduction of discoloration associated with port wine stains, and decreased diffuse redness of the face.
- Patient skin may continue to build heat for up to three hours. .
- Face may appear red for several days, although usually is only 0-3 hours.
- Although these are the most common results, each patient experience is individual.
